

Clarification of custom items validation

Dear XXXX

I am writing to you with reference to #2251 user story. In particular, I would like to address the functionality of the input field in the to-do list.

According to the 5-th acceptance criteria the user can add his/her own items to the to-do list. The input field that appears after clicking the "+ Add custom item" button must contain no more than 50 characters. While this story is generally clear, we have few points for clarification:

1. If there is a minimum number of characters required for the custom item input field. If there is no minimum, then we could consider adding one to ensure that users are entering meaningful items into the list.
2. What happens when the user tries to enter more than 50 characters into the input field? Does the input field prevent the user from typing any more characters after they reach the limit, or does it allow them to keep typing but only store the first 50 characters?

I hope these proposals are helpful and contribute to the success of the feature. We would appreciate Your feedback and any additional ideas You may have.

Yours Sincerely,
Solomiia Pryshliak

Clarification of the "+ Add custom item" button and the input field behaviour when adding a custom item to the to-do list

Dear XXXX

We are grateful for your contribution in preparing the documentation for us.

After analyzing the #2249 user story, I have a question regarding a potential scenario that could occur.

According to the 3-rd acceptance criteria, the user can add his own item to the to-do list by entering the name of the custom item and pressing ENTER or the "+ Add custom item" button. Therefore, I would like to clarify how the system should react in the case of leaving the input field empty, but pressing the button "+ Add custom item?"

We have a few suggestions on how we could handle this situation:

1. To display an error message prompting the user to enter a name for the custom item before attempting to add it to the to-do list.
2. To disable the "+" button until the user has entered characters for their custom item.

We believe it's important to consider for edge cases like this to guarantee a smooth user experience. Your perspective is highly valued, and we would appreciate Your ideas on this issue.

Yours Sincerely,
Solomiia Pryshliak

Specifying a name for the list of items

Dear XXXX

While analyzing the #2249 user story, our team has identified an ambiguity regarding the title of the list.

In the initial part of the user story You have used the term "to-do list" to refer to the list, where the standart and the custom items can be added. However, in the last two acceptance criteria, we noticed the term "shopping list" instead.

This inconsistency is concerning, as it can cause confusion for the team and potentially affect the user experience. To ensure clarity for the users, we would like to suggest implementing a "to-do list" option".

While "shopping list" refers to a specific type of list, a "to-do list" is a more general term that can refer to any list of tasks or items that need to be accomplished. This will make it easier for users to understand the purpose of the list and avoid any confusion or misunderstandings. Furthermore, using "to-do list" will also provide flexibility in case we decide to expand the feature in the future.

We value Your input and would love to hear Your thoughts on this matter.

Yours Sincerely,
Solomiia Pryshliak
